

SECURE AND EFFICIENT ACCESS FOR HEALTHCARE APPLICATIONS

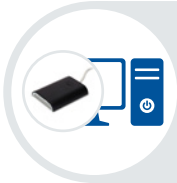

Protect your clinicians, patients and administrators and uphold stringent privacy requirements with the latest innovations in identity authentication technology from HID Global.

By implementing secure, contactless readers and access-ready devices hospitals and clinics are able to:

- Seamlessly secure access to IT resources, physical facilities, equipment and supplies using a single identity credential
- Utilize Single Sign-on (SSO) authentication, eliminating the need for passwords and reducing log-in time by 45 minutes per day or more
- Reduce costs by mitigating 90% of lost/stolen identification and password-related help-desk calls
- Prevent prescription drug theft and ease compliance with HIPPA and HITECH regulations

My workday begins as I arrive at the hospital, where my contactless card allows me to enter any location I need to access.

I can easily read updated information on my patients from any secure workstation in the building.

A new patient tells me their symptoms while a colleague securely prints a patient's records or forms for my review.

Controlled substances are secure in the pharmacy and require my ID authentication to access and provide for patients.

I am able to read my new patient's records on a tablet or mobile phone and determine a diagnosis without fear of misinformation or incorrect records.

I am able to spend less time with IT and more time delivering quality care for my patients.
